ANNUAL REVIEW OF PLANT PATHOLOGY

Climate Change Effects on Plant Pathogens: Using Artificial Intelligence to Translate Big Data

K.A. Garrett^{1,2,3}, D.P. Bebber⁴, B.A. Etherton^{1,2,3}, K.M. Gold⁵, A.L. ...

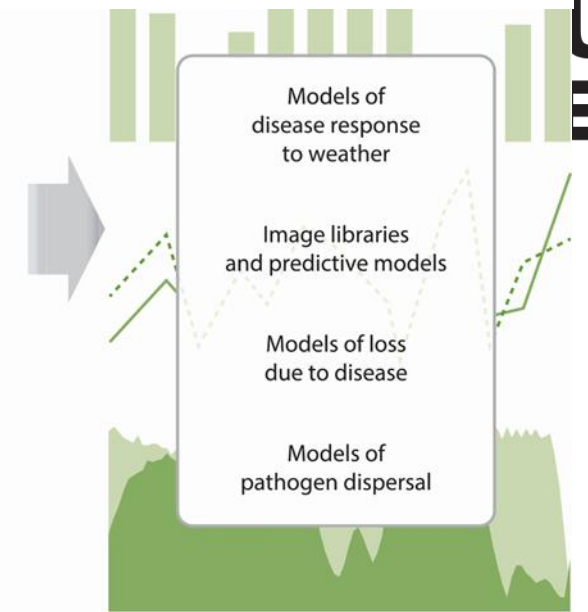

Data acquisition

Data integration

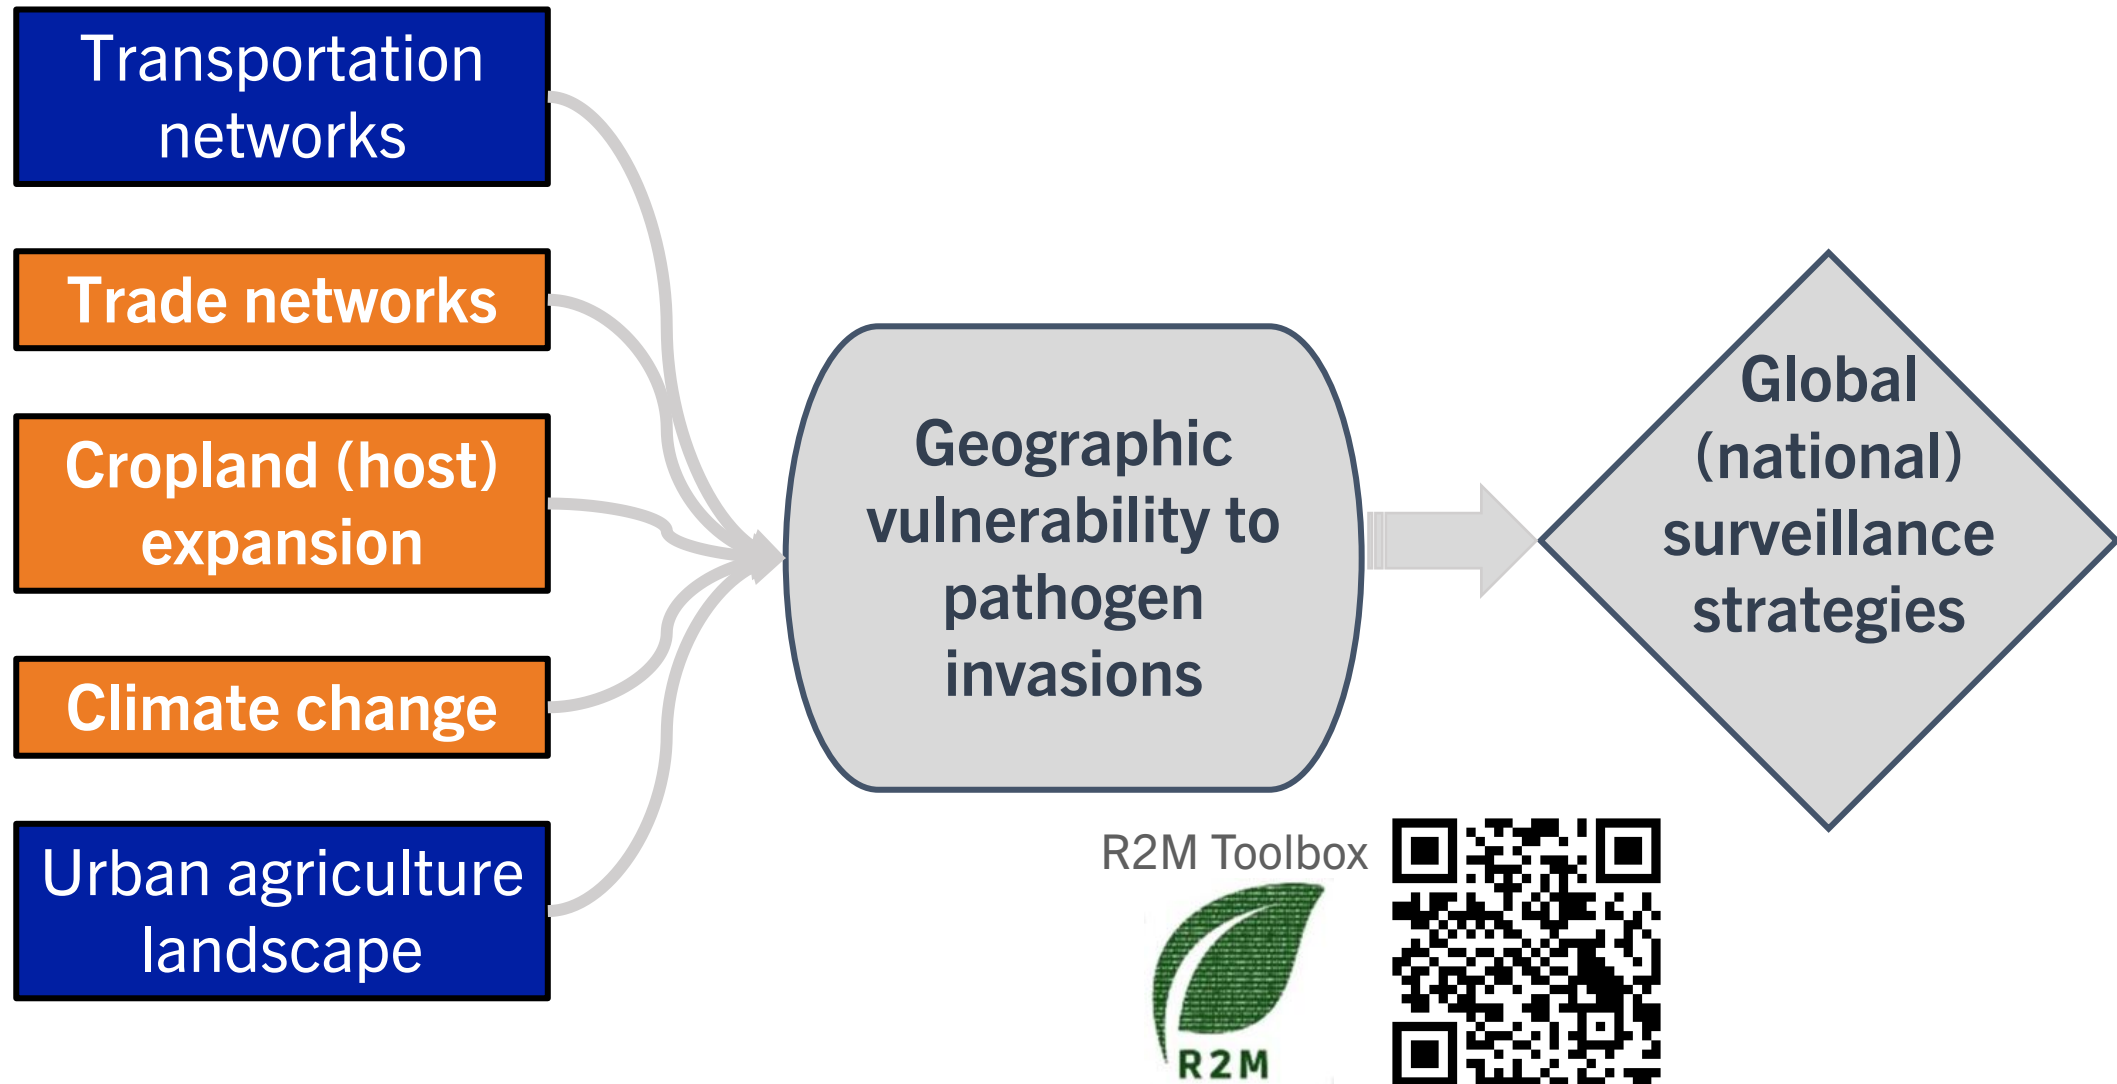

Model development

Decision-support tools

Integrated risk assessments are urgently needed

The “troublemaker”

An invasive complex

Harringtonia lauricola

Favorite food?

- ✓ Lauraceae trees
- ✓ 300 million redbay & sassafras

Dispersal pathways?

- ✓ Vector species
- ✓ Untreated wood*

Laurel wilt disease = pathogen* × susceptible host(s) × conducive environment

The “troublemaker”

An invasive complex

*Harringtonia
lauricola*

Management?

- ✓ US\$ 356 million
- ✓ Cost is problematic
- ✓ No global surveillance strategy

Laurel wilt disease = pathogen* × susceptible host(s) × conducive environment

Translating ecological perspectives to define biosecurity priorities for emerging diseases

**Invasion through
trade networks**

**Invasion through
host networks**

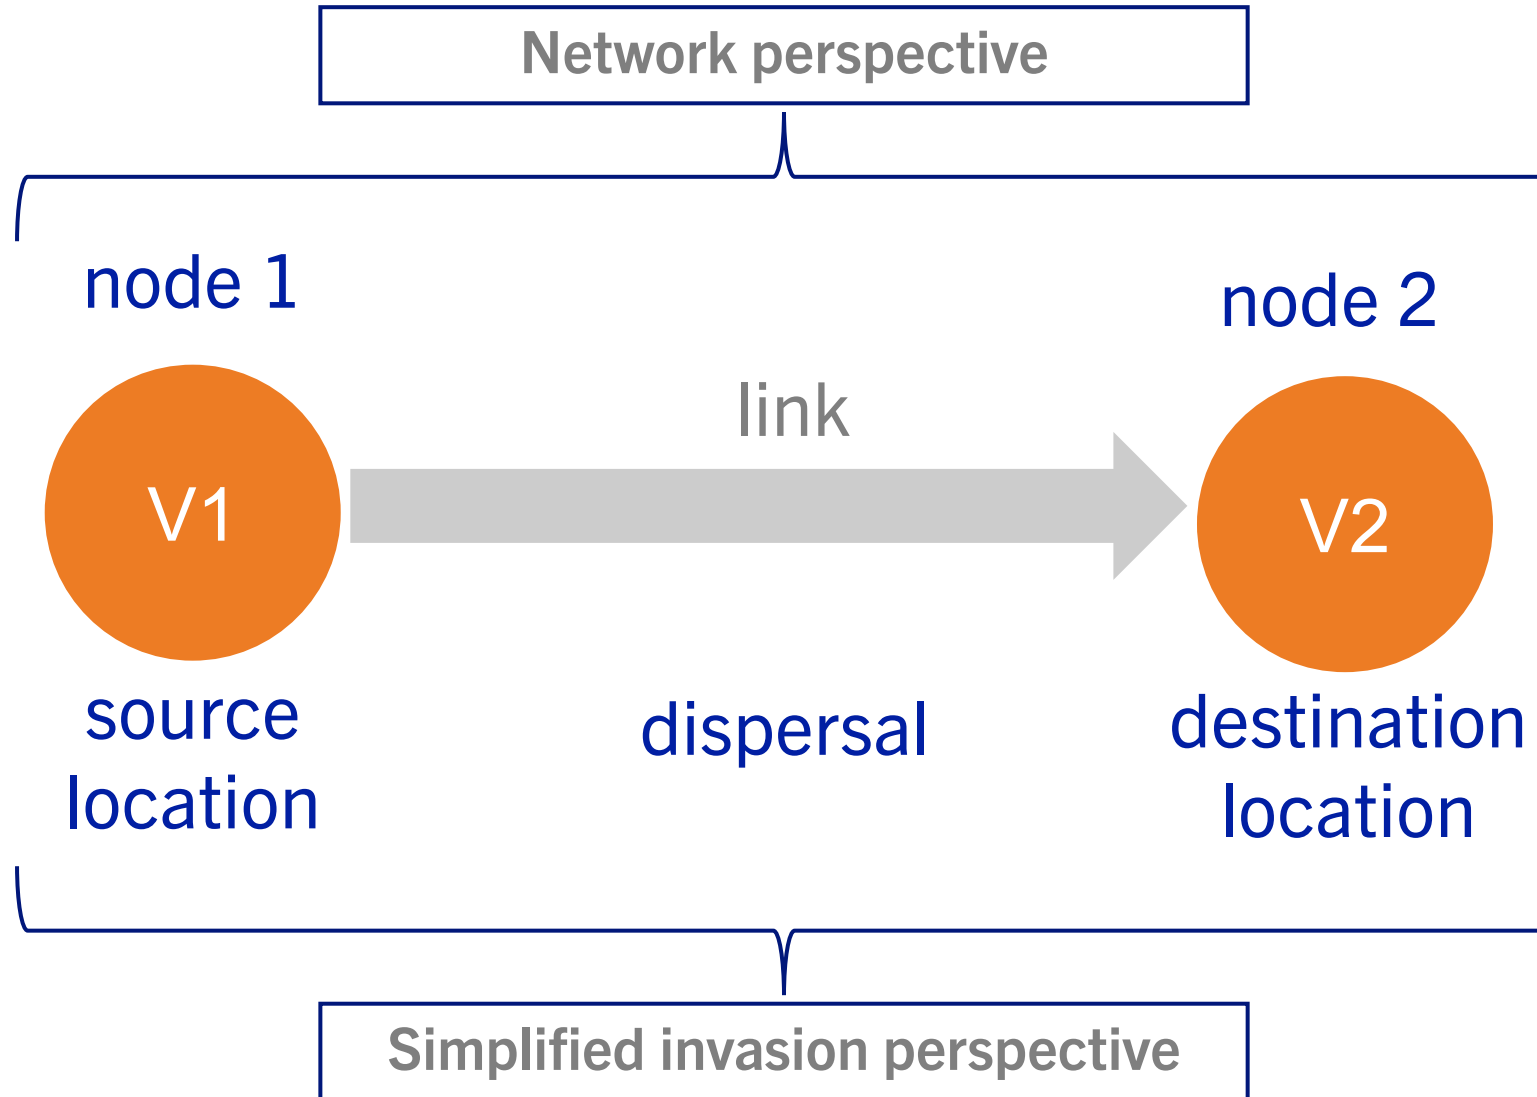

**Pathogen spread
with current climate**

**Pathogen spread
with future climate**

Pathogen “invasion” or epidemic networks

Potential pathogen dispersal through global network of wood packing material movement

Reported distribution of *Harringtonia lauricola*

- Absent
- Native
- Present
- Widespread

Relative pathogen invasion potential

- 0
- 200
- 400
- 600

Pathogen trade movement potential

- 0.25
- 0.50
- 0.75
- 1.00

Country category

- Intermediary
- Producer

Likely roles of locations in habitat networks

Forest (habitat) networks

- ❖ Geographic locations (nodes)
- ❖ Geographic connections (links)

Geographic priorities

- ❖ geohabnet

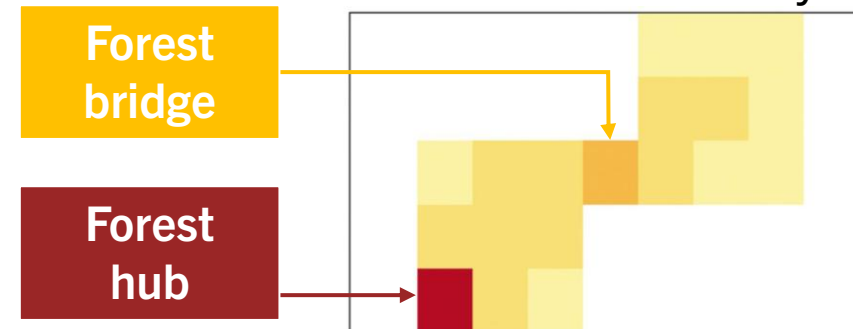

Map of hypothetical forest landscape

Hypothetical forest network

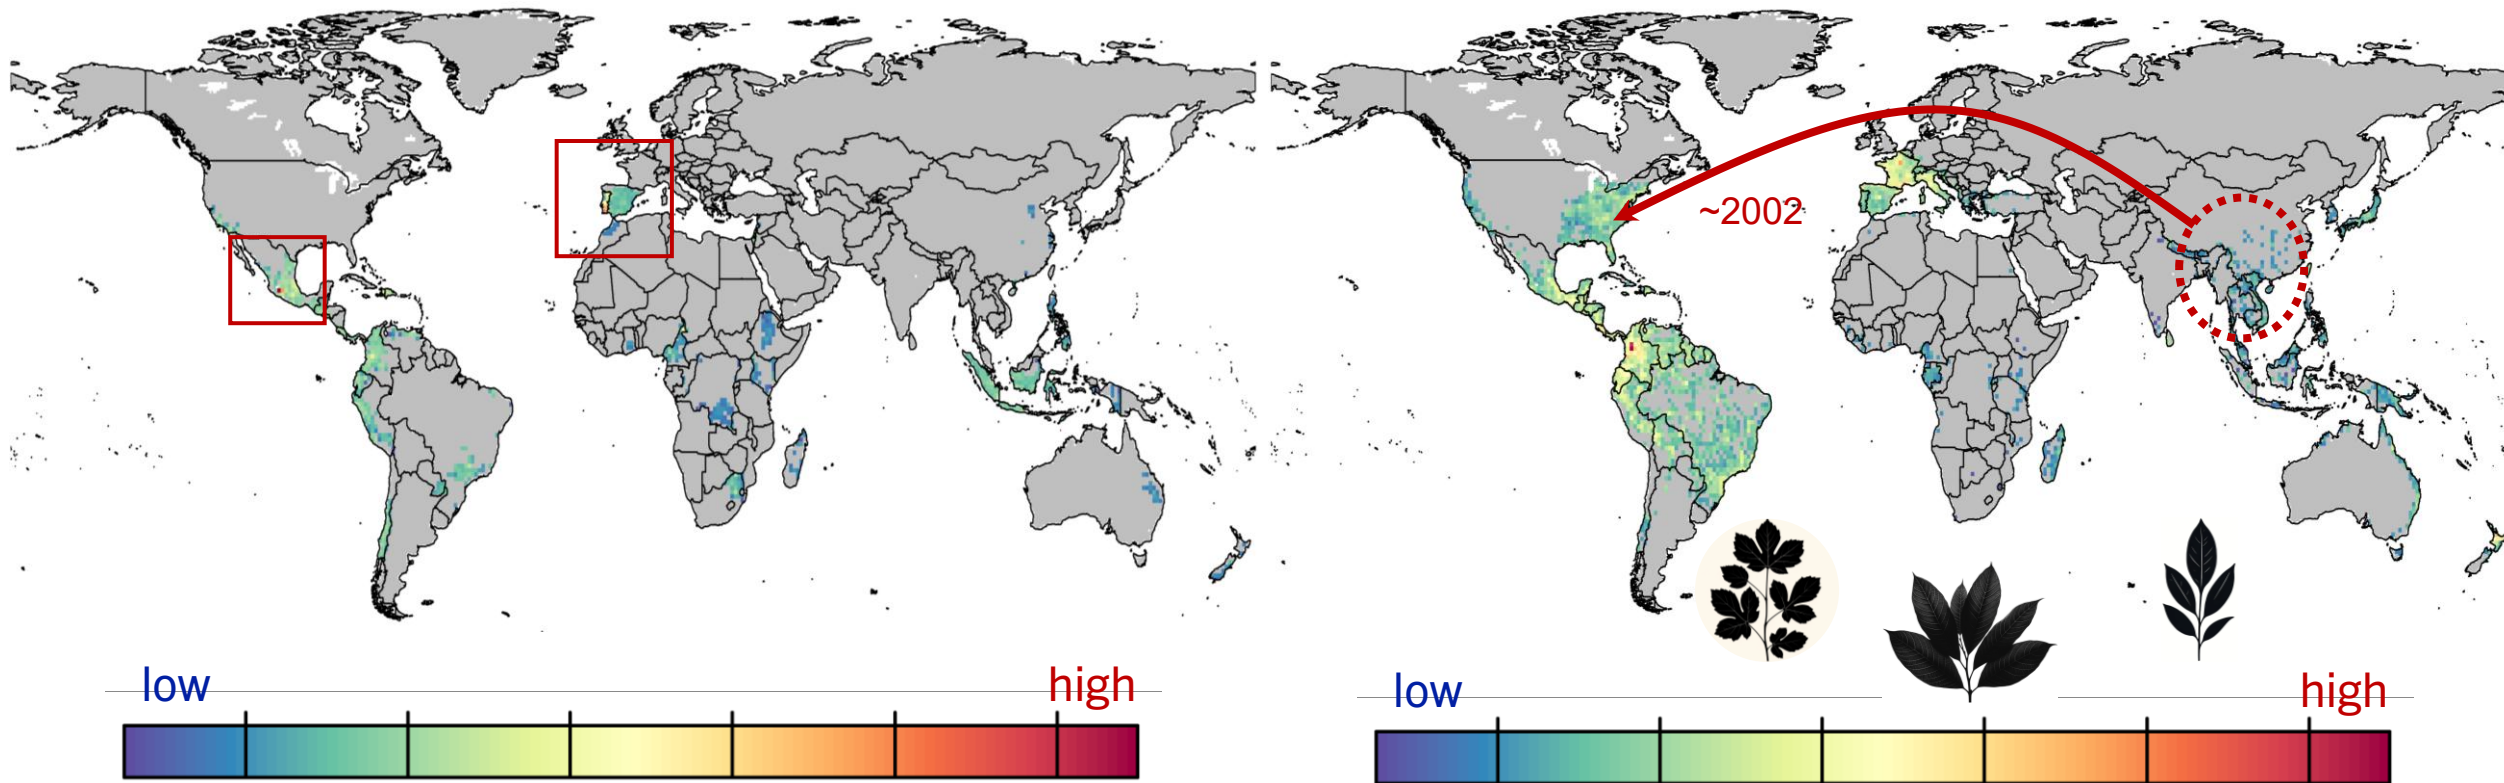

Resulting map of forest connectivity

Global host connectivity for pathogen invasions

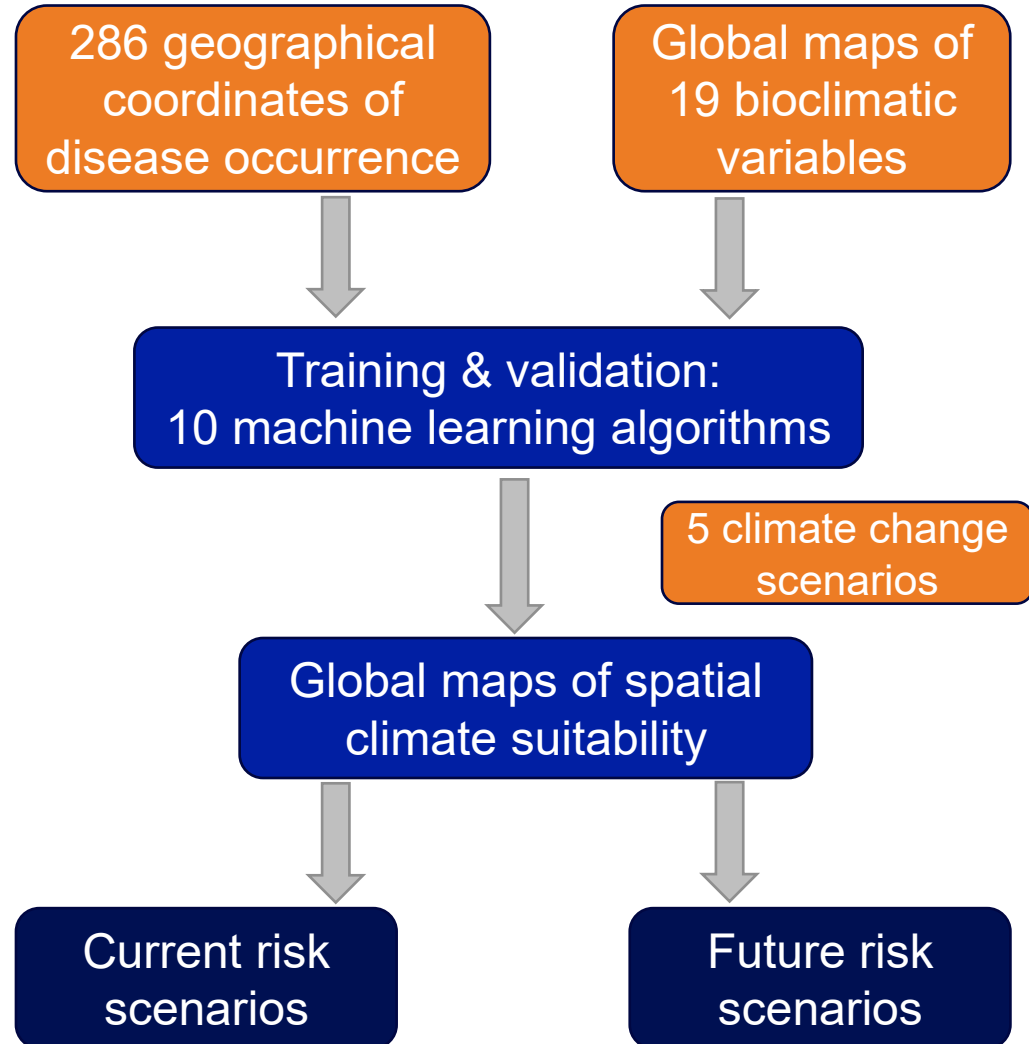

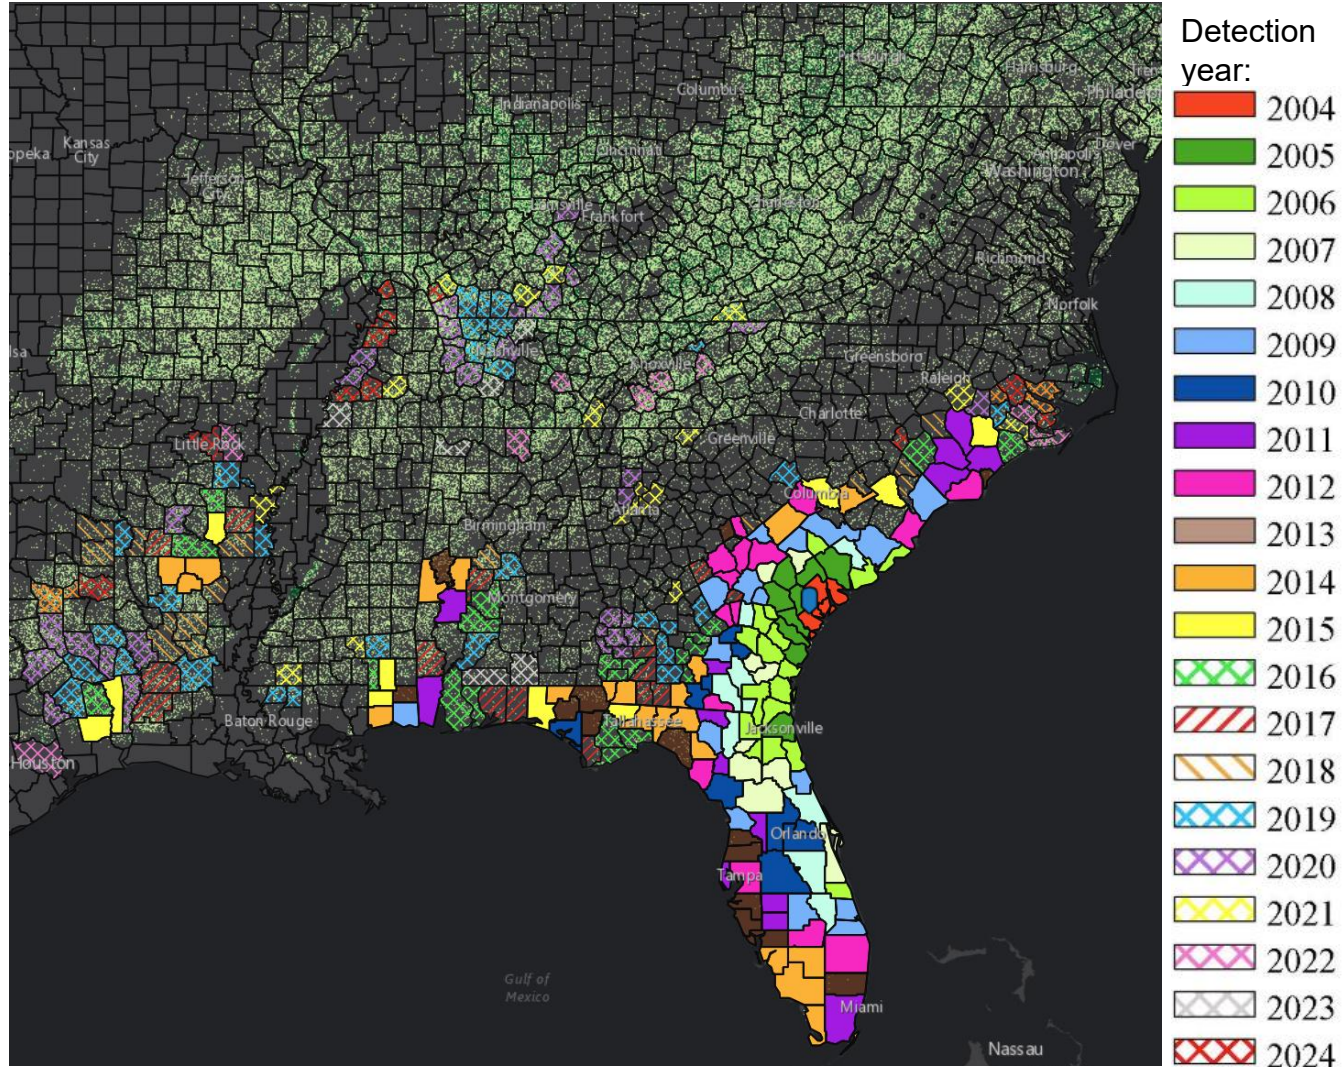

Example for laurel wilt (*Harringtonia lauricola*)

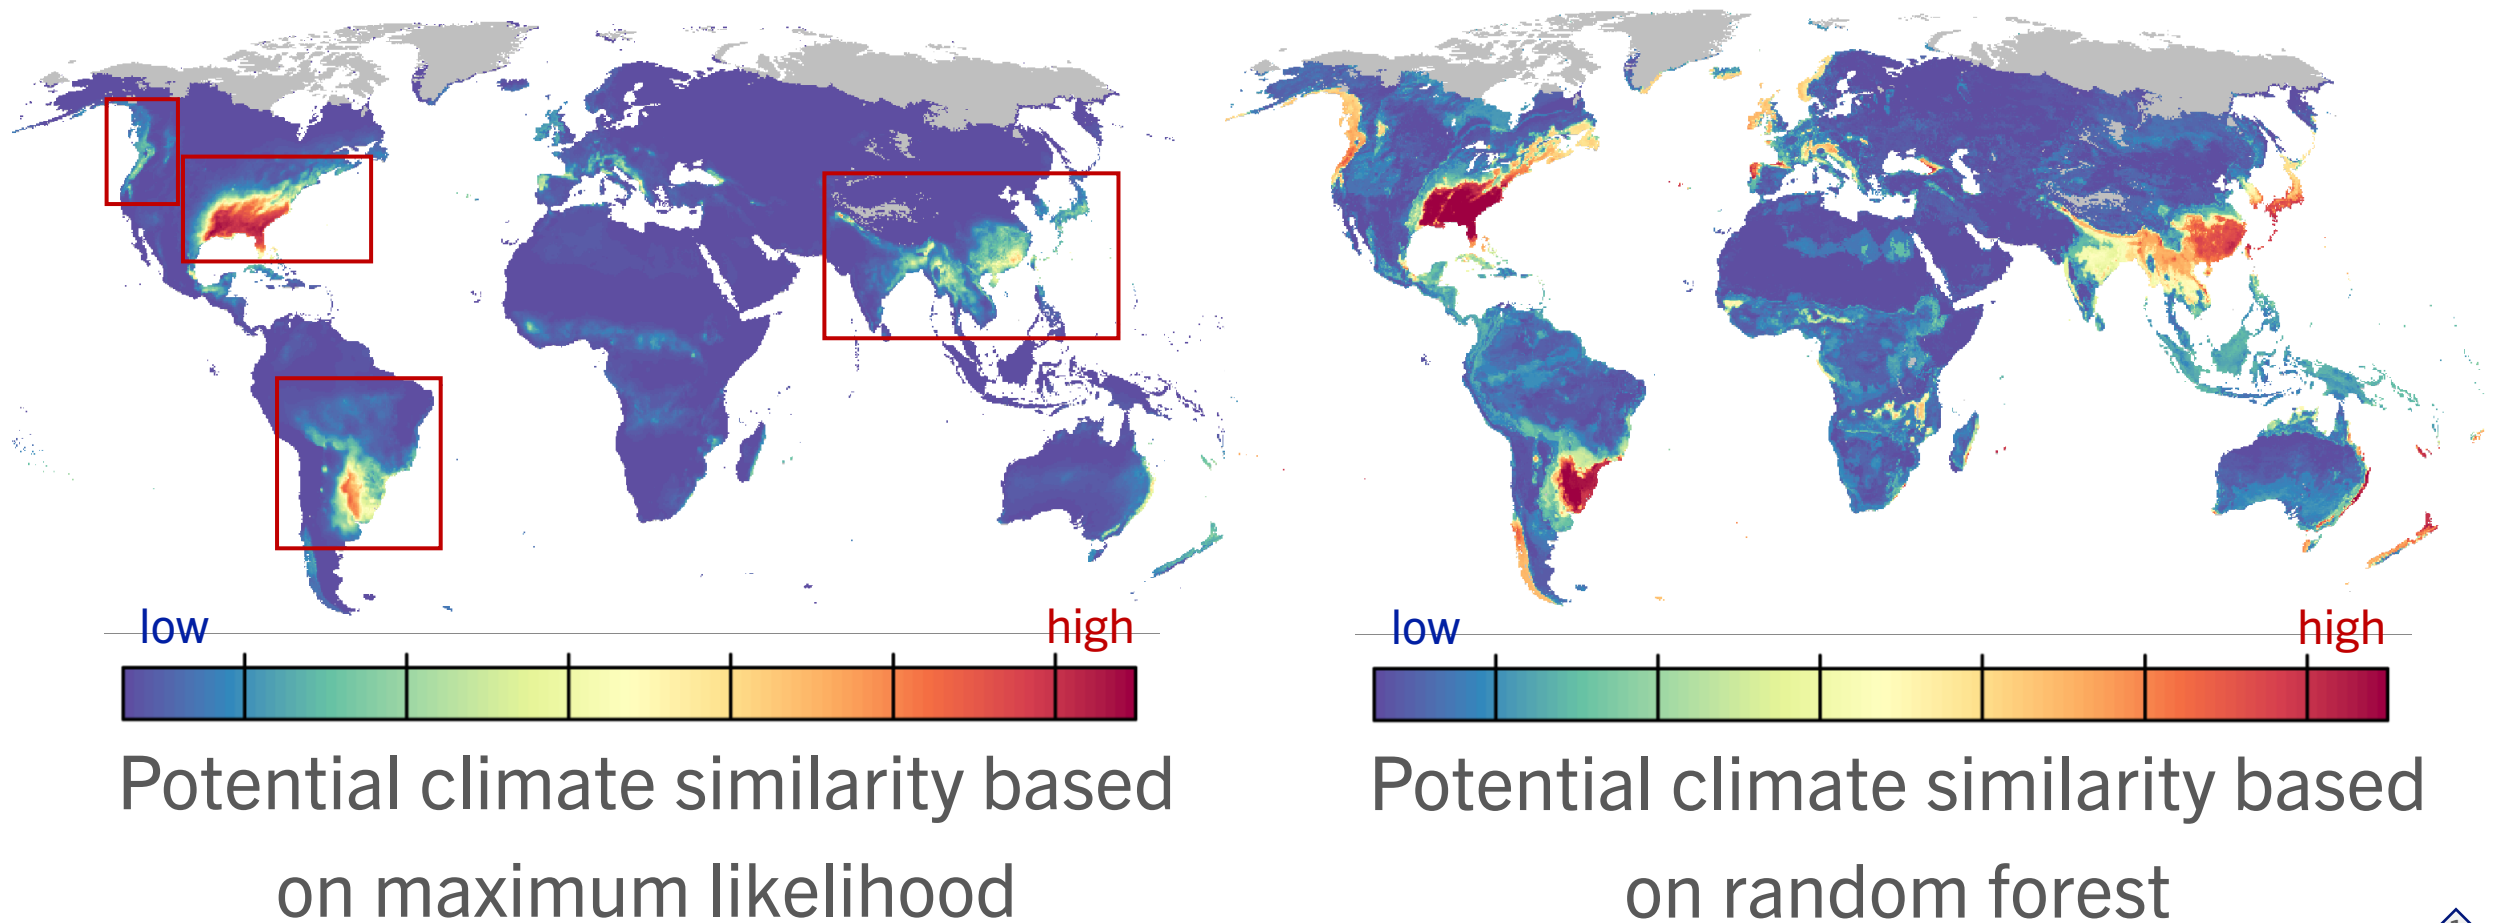

Host landscape connectivity for
avocado (*Persea americana*)

Host landscape connectivity for
2271 Lauraceae species

Quantifying climate risk for diseases

Projected risk scenario based on current climate suitability conditions (1981-2010)

Projected future climate risk scenarios (2061-2080)

Can you spot 10 differences...?

Current climate (~2010)

Future climate (2061-2080)

**Latitudinal
range shifts**

Potential risk change based on
future climate scenarios

The proposed global surveillance strategy

Invasion through trade networks

- ❖ Prioritize surveillance in countries highly connected in the global network of wood packaging material.

Invasion through host networks

- ❖ Increase preparedness for laurel wilt in highly connected regions in the host landscape.

Climate-smart surveillance targets

- ❖ Keep track of potentially climatically suitable regions considering current and future risk scenarios.

Integrated surveillance systems

- ❖ The surveillance system depends on the collective actions by the industries, forest conservation and the public.

Thanks!
